

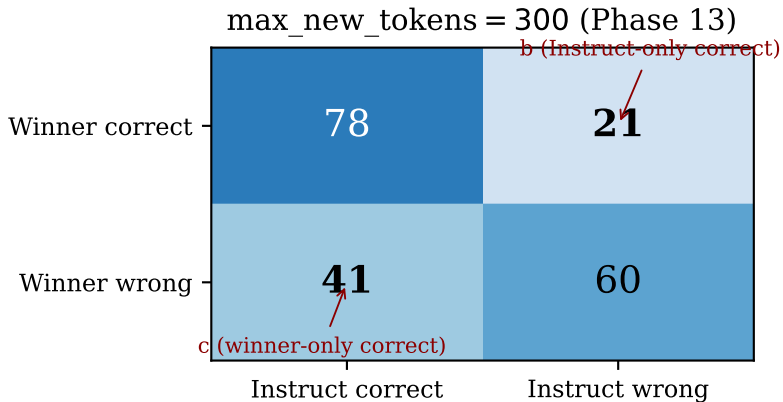

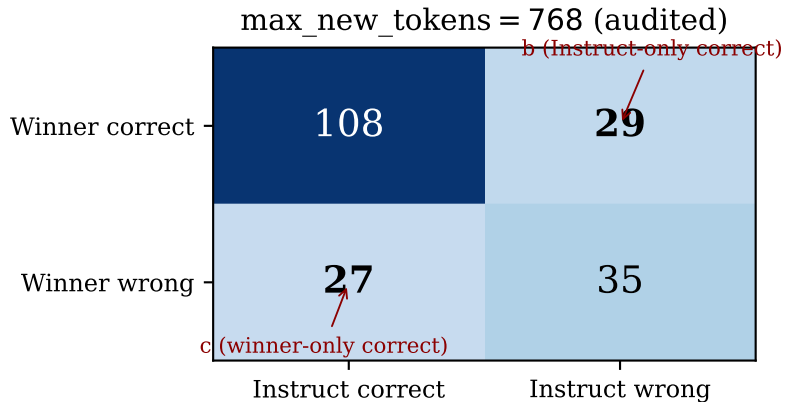

Figure 1: Paired McNemar contingency before and after the truncation audit.
The +10 pp claim under $\text{max_new} = 300$ flips to -1.0 pp under $\text{max_new} = 768$;
 b and c are the discordant cells McNemar's test sums over.

$b = 21, c = 41, p = \mathbf{0.015}$ (winner +10 pp)

$b = 29, c = 27, p = \mathbf{0.89}$ (winner -1.0 pp)
